

BookNook — Personal Reading Tracker

Project requirements draft

I want to build a personal reading tracker app where users can manage their book collection and track their reading progress over time.

User accounts

Users should be able to register, log in, and recover forgotten passwords. Each user has a profile with their name, avatar, and favorite genres.

Books

Users can add, edit, and remove books from their library. Each book stores a title, an author name, the total page count, and an optional cover image. The interface for adding a book should be modern and intuitive so anyone can use it easily. Adding a new book should be fast.

Reading progress

Users can update their reading progress by entering the page they are currently on. The system shows a beautiful progress visualization for each book. Books can be marked as currently reading, completed, or want to read.

Reading list and search

The reading list should be displayed in a clean, organized way. Search and filtering by genre, author, or status should be quick.

Discovery

Users can see a discovery feed of what other people are currently reading. The discovery feed should be engaging. Recommendations should be relevant and helpful, based on what the user has read previously.

Reviews

When a user finishes a book, they can leave a short review. Reviews are public and other users can see them.
