

FitTrack — Personal Workout Tracker

Project requirements (draft) · prepared by Owise Zoubi

I want to build a simple fitness tracking app that my friends and I can use to log our workouts and see our progress over time. The goal is to keep it minimal — I'm not trying to compete with Strava or MyFitnessPal — just something clean that helps us stay accountable.

What users should be able to do

The core feature is logging workouts. Every workout entry should include:

- The type of workout — one of: cardio, strength training, yoga, or "other".
- The date and time it happened.
- Duration in minutes.
- Optional notes — e.g. "felt great" or "low energy day".

Users should be able to view a list of all their past workouts, sorted by date with the most recent first. They should also be able to edit or delete an entry after creating it.

Weekly summary view

There should be a "This Week" summary page that shows:

- Total workouts this week.
- Total time exercised this week.
- A breakdown by workout type — e.g. "3 cardio, 2 strength, 1 yoga".

Goals and progress

Users should be able to set a weekly goal — for example, "I want to work out 4 times per week" or "I want to do 180 minutes total per week." The home screen should show a progress bar indicating whether they're on track for the current week. When a user hits their goal, show a small celebration — confetti, a badge, anything fun.

Other notes

The app should look clean and minimal — I'm imagining something close to the Apple Health style: lots of white space, soft colors, big numbers. It needs to work on mobile browsers since we'll mostly use it on our phones.

Down the line I might want to add the ability to see what my friends are doing — like a small feed of their recent workouts — but that's not a must-have for the first version.
